

5 MOST DANGEROUS PAIN MEDICATIONS

Although the common pain meds covered in this article appear to be used by ‘everyone’ – including celebs, sports heroes, and possibly your friends at work – it doesn’t mean they’re safe or without consequence..

This article not only outlines the dangers, it also offers a huge wake-up call to those who may have just gone with the flow, using the products they’ve been prescribed, heard about from friends, or seen advertised on TV or in magazines – without recognizing the dangers and risks.

Most people aren’t aware of the toll that over-the-counter and prescription meds are taking until it’s too late and their bodies are manifesting symptoms! And sadly for some, they don’t have the ‘courtesy’ of symptoms. Their first warning is sudden death!

You may not realize that:

“Drugs never cure disease. They merely hush the voice of nature’s protest, and pull down the danger signals she erects along the pathway of transgression.

Any poison taken into the system has to be reckoned with later on even though it palliates present symptoms. Pain may disappear, but the patient is left in a worse condition, though unconscious of it at the time.” Daniel. H. Kress, M.D.

“The person who takes medicine must recover twice, once from the disease and once from the medicine.” William Osler, M.D.

More and more we’re hearing of the dangers and risks in using over-the-counter or prescription meds through the media. But for some, the info and warnings will come too late. Their body has already paid a price.

Consider the possibility that for centuries, pain relief came from nature, working in harmony WITH the body. The same benefits are available to you today. Not only are there safe, effective, non-toxic solutions for many who are addicted to pain meds, they’re completely affordable, fast-acting, and easy to use.

**Advil... Aleve... Bayer... Celebrex... Demerol... Motrin... Naproxen...
Oxycontin... Percocet... Tylenol... Ultram... Vicodin...**

Find out which are safe and which can be deadly...

When you think of dangerous drugs, what comes to mind first? Heroin?... Cocaine?... LSD?...

... **How about pain pills?**

Pain medications and adverse drug reactions are the 4th leading cause of death in the U.S... only behind heart disease, cancer and strokes!

What does this mean to you?

It means your risk of dying from that pain medicine in your cabinet could be higher than your chance of dying from diabetes, lung disease, or even an accident – unless you take heed to this special report.

The results of our investigation are shocking... **But they could save your life.**

DANGEROUS PAIN MEDICINE #1: COX-2 INHIBITORS

Common names: Celebrex, celecoxib

How would you like to **triple your risk of heart attack?** Just pick up a prescription of Celebrex.

While studying the drug's potential as an anti-cancer drug, the National Cancer Institute discovered:

- ✔ **Those taking 400mg doses had 250% greater risk of dying from heart attack or stroke... and those taking the 800mg doses has 340% times the risk!**

Scary, isn't it? The good news is, there are many pain relievers that are just as effective, but don't come with the harsh side-effects and dangers. [The WholeBody Collection . . . from Green Organics!](#)

DANGEROUS PAIN MEDICINE #2: NSAIDS

Common names: Advil, Aleve, ibuprofen, naproxen

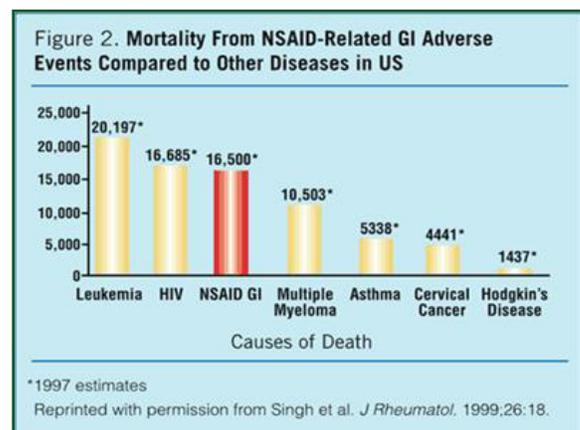

Do you have some kind of chronic pain? **Arthritis... back pain... neck pain...** something else?

Chances are you've been taking one of the common NSAIDs like ibuprofen or naproxen to deal with the pain.

And speaking of chances...

➔ **The odds of dying from taking a nonsteroidal anti-inflammatory drug after just two months is around 1 in 1,200.**

➔ **Roughly 16,685 people die each year from NSAID related complications... making them just as dangerous as AIDS!**

The biggest known risk of NSAIDs is from gastrointestinal ulcers and bleeding.

We're not talking about a little tummy ache here, but severe bleeding and possibly death after the medicine destroys your gut. And that's not the only known risk.

DANGEROUS PAIN MEDS #3: OPIATE-BASED PAIN MEDS

Common names: Vicodin, Lorcet, Norco, Percocet, Percodan, hydrocodone, oxycodone

If you've ever had surgery, a major accident, or any other major trauma to your body... you were likely given an opiate-based pain med to knock out the pain.

Unfortunately, knocking out the pain has its consequences!

- ✔ **16,000** – That's the number of people who died in the United States in one year from drug overdoses. Most were caused by opiates.
- ✔ **In 2002... deaths from prescription opiate overdoses had nearly doubled.**

DANGEROUS PAIN MEDS #4: ACETAMINOPHEN

Common names: Tylenol, acetaminophen

Even the "doctor's choice" is disturbingly dangerous to take! Just check out these stats if you don't believe me...

- ✔ Every year, more than **56,000 people will visit the emergency room due to acetaminophen overdoses.** It's the leading cause of calls to Poison Control Centers.
- ✔ It's the leading cause of acute liver failure, causing nearly half of all cases!

DANGEROUS PAIN MEDS #5: SALICYLATES (ASPIRIN)

Common names: aspirin, acetylsalicylate

Think aspirin is safe? Think again!

- ➔ Higher doses or prolonged use at the lower dose – even in buffered or coated form – **can double your likelihood of perforated ulcers and gastrointestinal bleeding.**
- ➔ **Research shows 90–95% of Reye's Syndrome cases were preceded by taking aspirin.** The disease devastates internal organs, particularly the brain and liver, and at least **10% of those affected will die even with early treatment.**

Imagine being able to relieve your pain – pleasantly, inexpensively, and with natural non-toxic compounds from nature, – without the dangerous and toxic drugs you've read about here . . . Not only is it possible, its our mission to share this powerful message!
